

Supplementary Fig. 1. Estimated timely recovery probability according to TAVR month

The solid line indicates the estimated probability of timely recovery according to TAVR months with the shaded area representing the 95% confidence interval. The vertical dashed line denotes the introduction of remimazolam in July 2021. Before July 2021, dexmedetomidine was the primary sedative, and after July 2021, remimazolam became the primary sedative in most TAVR procedures.

Abbreviations: TAVR: transcatheter aortic valve replacement.
