Suprascapular notch cross-sectional area by MRI do not yield accuracy in the diagnosis of suprascapular nerve entrapment – counter point of view

- Response to Letter to the Editor -

Thank you so much for your kind opinions. How grateful we are for carefully reading this paper and for providing various anatomical opinions. As the authors have noted, we are aware that the study we conducted has some limitations. It is similar to what the editor and reviewers said during the previous revision. That's why most of what you said has already been mentioned in the Limitations section of this paper. In one conclusion, We strongly agree with what you said about the diagnostic usefulness of ultrasound. Therefore, we are working hard to analyze MRI and ultrasound to analyze a more accurate integrated diagnostic tool. As mentioned, ultrasound has many advantages, but it has the disadvantage that the test result can be influenced by the examiner. We think it would be really good if these limitations could be compensated for through MRI. Thanks again for the nice opinions.
